Signal/Monitor · B2B Account Signal Monitor

Components Map · Aryan Wadhwa · MESA Problem Statement 18

Twice a week Arjun learns which of his accounts have a real trigger right now — and why. Live news is read by Gemini Flash, scored by code, written back to his Supabase CRM **without touching his own notes**, and emailed as a Hot List. **Live:** signal-monitor-two.vercel.app

ACTOR	TRIGGER	INPUT	CONTEXT	I
Vercel Cron Scheduler	**Fires Mon & Thu, 07:30 IST** `0 2 * * 1,4` calls the secret-protected scan; the same run builds and sends the Hot List			
Arjun Sales rep · human	**Can hit "Scan now"** signed in, any time between the two scheduled runs; viewing the radar needs no login			
Arjun's CRM Supabase · accounts table		**His book of 20 accounts** stage, frontline workforce, shift-based, sites, key contact and last-contact date	**His own judgment, read-only** notes and his read on each relationship shape the angle's tone — never edited DB trigger blocks every system write here	
Google News RSS External · live		**Live headlines for every account** two searches each (name, and name + trigger words), India edition, last 14 days LinkedIn cut: no public API

THE CUT

Arjun pictured signals from LinkedIn and a system that acts on them. Check 03: LinkedIn has no public feed, so news and press carry the same triggers. Check 06: an AI email to a new CHRO is too costly to get wrong, so the system drafts and Arjun sends.

TESTED LIVE

20 accounts, 476 live headlines, 35 real triggers on the first scan (e.g. Apollo's new Head of HR, Zepto's IPO filing). Arjun's fields untouched on every run; the DB refused the overwrite test; Hot List delivered from production.

NEXT (NOT BUILT)

Slack or HubSpot alerts change only the Output row; an official LinkedIn data partner would change only the Input row. Context to Processing is reused as is.
